

22% of households who took the shots have a COVID vaccine injury

 Send to Kindle

Nearly 65,000 votes! Dr. Drew has a broad audience.

Look how close my poll came to Dr. Drews. Nearly identical. If polls on X are "worthless" how did we get the same results?

Here's the math on Dr. Drew's poll (which gave results nearly the same as my poll):

So if someone got the shot, over 22% of the households had a vax injury.

```
julia> a=17.2; b=60.4
60.4

julia> a/(a+b)
0.2216494845360825
```

I'd guess that half the people in America would never believe they got a vaccine injury (because they are gaslit by their doctors), so the true estimate is likely over 40% of US households where someone took the jab have someone who is vaccine injured.

That's a train wreck, but I'm pretty sure the CDC isn't going to stop until 100% of households have at least one vaccine injury. Then they will declare "Mission Accomplished" and probably do a dance video such as this one:

vaxxed, 3 or more injured
Virus/hosp. protocols killed more
Don't know any who died of either

And just to calibrate the answers, this last question is very important:

I think vaccines ARE safe
BEFORE the COVID shots released
AFTER the COVID shots released

This is a train wreck. Anyone can do this poll if you think the polls are inaccurate.

For example, if the CDC thinks these surveys are wrong, they should do their own surveys and publish them.

CNN, NY Times, Wall St. Journal, etc. are never going to do such a poll.

Nobody really wants to know how many American households have been decimated by COVID vaccine injuries. Everyone who is injured is gaslit into believing they are just the “rare” case of a side effect.

This is why censorship is so important. So nobody will find out the truth.
